

Introduction

In my game, Echoes of the Heart, players try to impersonate a psychologist through email conversations, while choosing dialogue responses to maintain a believable persona. In order to, enhance variety and replayability, the PCG can be used to generate small variations in the psychologist's dialogue styles and topics.

1) Dialogue rephrasing generator: The use of a grammar-based RCG approach, the system will dynamically rephrase the psychologist's email responses while keeping the same meaning but changing the tone (for example from formal to academic).

2) Introduce dynamic topics: From a variety of psychological subtopics (for example love language, ethical dilemmas), the system could introduce small thematic changes per session, which will influence the flow of the conversation.

Actor Roles

Designer:

1. Evaluation: Defines tone variations and sets rules for credibility scores.
2. Generation-Base Design : Provides templates for email structures, psychological theory and emotional tone guidelines. For example, how love language can be discussed in casual vs academic tone.

Computer:

1. Evaluation: Procedurally generates rephrased dialogues and inserts a variety of themes during the game.
2. Generation: Uses grammar rules to rewrite the email prompt from "clinical analysis" to "personal anecdote" style.

Player:

1. Evaluation: Selects from procedurally generated response options and evaluates believability through the gameplay success/credibility score.
2. Generation: Player chooses a response that matches the conversation tone in order to avoid detection-suspicion.

Use of Togelius et al.'s taxonomy:

- 1) Online generation: Content generated during gameplay
- 2) Optional content: Adds variety without changing core mechanics
- 3) Stochastic and parameter vectors: Uses random sources for the variation between the designer and the defined parameters
- 4,5) Generate and test: The system evaluates the content based on if the tone alignment and the coherence

Smith's MDA:

Building Blocks: Tone modifiers, topic injectors, credibility scoring model.

Game Stage: The content generates while playing

Interaction Type: Player's choice affects the next outcome

Player Experience: More replayability, encourages to explore more psychological themes, deeper reflection on ethics and love.

PCG adds more dialogue variety, new topics and encourages players to play again and keeps them more involved in Echoes of the Heart. Clear roles for Designer, Computer and Player to keep organized the content creation and the checking process, by following the PCG models.
